

ENABLE VISTA'S ADMINISTRATOR ACCOUNT

Source: By *Kevin Purdy*, Jan 7 2008

For the average Windows Vista session, the "Needs your permission to continue" prompts are just momentary, occasional annoyances which can be **disabled** or **bypassed**. But if you're planning to do a lot of tweaking or installations, having a dedicated Administrator account—like the kind available in XP—can be mighty helpful. The How-To Geek blog shows how to enable (and disable) the account from the log-in screen:

- First you'll need to open a command prompt in administrator mode by right-clicking and choosing "Run as administrator"
- Now type the following command:
`net user administrator /active:yes`

Log out and you should see an "Administrator" account available. Un-doing the tweak requires running nearly the same command, but with `/active:no` at the end. Like the Geek, we'll note here that only experienced users who know exactly what they're doing should use this type of account, and that Microsoft obviously doesn't want you to do this as a normal thing. All the same, it could be a boon for easier troubleshooting.

Enable the (Hidden) Administrator Account on Windows Vista
